

## MAKING THE RED TO GREEN TRANSITION

Today's environmental and economic climates strongly suggest that all companies consider their facilities' place in their business plan. Due to the significant energy consumption of Mission Critical facilities, this suggestion becomes an imperative. Careful analysis of current operating expenses (Red Building configuration) and the options available to optimize energy usage (Green Building configuration) can be the first step in improving fiscal and environmental health.

REES' **FACILITY BUSINESS PLAN®** is the foundation necessary to accomplish the red to green transition. During the **FACILITY BUSINESS PLAN®** process, we examine high energy usage brought about by short cycling air, inefficient cooling system infrastructure, or electrical system inefficiencies. We also address issues such as growth strategy, operating parameters, and system redundancy risk/investment tradeoffs.

Following completion of the **FACILITY BUSINESS PLAN®**, REES provides options to achieve client goals in the areas of energy savings, operational cost reduction, return on investment, reduced carbon footprint and alignment with real estate and IT strategies.
